Academic Year: 2025-2026
Major Project Supervisor Selection Form

I have read and understood the guidelines outlined under the B.Tech. VTR UGE-21 Regulations. Below are the details of our Major Project:

PROJECT DETAILS:

TITLE OF THE PROJECT: REAL -TIME SUSPICIOUS ACTIVITY

DETECTION USING CNN - LSTM AND ~~ANOMALY DETECTION~~

DOMAIN OF THE PROJECT: ARTIFICIAL INTELLIGENCE

SUSTAINABLE DEVELOPMENT GOAL (SDG) CATEGORY: SDG 11 - SUSTAINABLE CITIES AND COMMUNITIES

TYPE OF THE PROJECT: AI - BASED SURVEILLANCE SYSTEM

I hereby declare that I will strictly adhere to all procedures and guidelines associated with the Major Project. I further affirm that the project will be executed independently by me, under the supervision of the assigned internal guide.

STUDENT DETAILS:

S.No	VTU No	Register No	Name of the Student	Signature

TITLE & ABSTRACT:

Title: Real-Time Suspicious Activity Detection Using CNN-LSTM and Anomaly Detection

Abstract: SafeCrowd Vision is an AI-based real-time surveillance system designed to enhance safety in densely crowded public spaces such as railway stations, markets, religious gatherings, and stadiums. Traditional monitoring methods often depend on human vigilance, which can be unreliable in high-density environments due to fatigue and oversight. To overcome these limitations, this project leverages advanced deep learning techniques to automatically detect suspicious activities and potential theft, significantly improving situational awareness and response capabilities.

The system combines Convolutional Neural Networks (CNN) and Long Short-Term Memory (LSTM) networks to analyze both spatial and temporal aspects of crowd behavior. CNNs extract key visual features from video frames—such as people, objects, and movements—while LSTMs analyze sequences of frames to detect anomalies like sudden running, tailgating, object grabbing, or unauthorized access. To further enhance accuracy, the system uses anomaly detection to compare real-time behaviors with learned normal patterns and integrates object tracking algorithms like YOLO and DeepSORT for identity tracking across frames.

SafeCrowd Vision operates in real time and issues automatic alerts to security personnel via mobile devices or dashboards when threats are detected, ensuring quick and proactive responses. Its flexibility allows integration with fixed CCTVs, drones, or mobile surveillance units. Trained on diverse datasets containing real and synthetic suspicious activities, the system is robust and adaptable to various environments, offering a scalable and intelligent solution to modern crowd safety challenges.

Keywords: Suspicious Activity Detection, Crowd Surveillance, Deep Learning, Convolutional Neural Networks (CNN), Long Short-Term Memory (LSTM), Anomaly Detection, Computer Vision, Theft Detection, Real-Time Monitoring, Smart Surveillance, Behavior Analysis.

8. POSTER PRESENTATION

Real Time Suspicious Activity Detection Using CNN and LSTM

Mutharasi.a, Anitha.D

Vel Tech Rangarajan Dr. Sagunthala R&D Institute of Science and Technology

Abstract

Public safety monitoring in densely populated environments such as transportation hubs, marketplaces, stadiums, and large public gatherings remains a critical challenge due to increasing incidents of theft, violence, and unexpected crowd disturbances.

Conventional video surveillance systems rely heavily on continuous human supervision, which is inefficient, error-prone, and unsuitable for real-time response in complex crowd scenarios. To overcome these limitations, this paper presents SafeCrowd Vision, an intelligent real-time surveillance framework that integrates visual and audio intelligence for automated detection of suspicious activities in crowded spaces.

Introduction

Rapid urbanization and increasing population density have significantly raised safety concerns in public spaces such as transportation hubs, commercial areas, and large social gatherings. These environments often experience high crowd movement, making them vulnerable to incidents such as theft, violent behavior, and sudden disorder.

To overcome these limitations, this paper proposes Safe-Crowd Vision, a real-time multimodal surveillance system that combines visual intelligence and audio analysis to identify suspicious activities in crowded environments. The framework utilizes CNN-based feature extraction for spatial understanding and LSTM-based temporal modeling to recognize behavior patterns such as theft and violent interactions.

Table 1.1 Performance Metrics of Suspicious Activity Detection

Metric	Value
Total videos tested	50
Videos detected as suspicious	20
Accuracy (if ground truth available)	85%
Precision / Recall / F1 (if labeled dataset)	0.87 / 0.83 / 0.85

Methods and Materials

Methods

SafeCrowd Vision is a system that uses real-time smart surveillance to watch over busy places like malls, airports, train stations, and public events. It combines computer vision and sound analysis to spot unusual activities that might threaten safety.

- Object Detection
- Object Tracking and Association

- Abnormal Behavior Detection
- Theft Detection

- Violation Detection

- Audio Anomaly Detection

Results

SafeCrowd Vision was thoroughly tested through several experiments to confirm how well it can detect theft, violence, and unusual sounds in crowded areas. Accurate real-time detection of suspicious activities.

- Effective spatio-temporal analysis using CNN + LSTM models.

- Reliable object tracking with YOLO + DeepSORT across video frames.

- Low false positives/negatives compared to traditional surveillance systems.

- Seamless integration with CCTV cameras, drones, or mobile surveillance units.

- Timely alerts/notifications sent to security personnel via dashboard or mobile devices.

Fig 2.Result

Discussion

The system effectively enhances pedestrian safety near busy crossings, especially at bus stops and school zones, by integrating high-resolution cameras and radar sensors for real-time situational awareness.

Pedestrians often choose unsafe road crossings over Foot Over Bridges (FOBs) due to convenience, increasing collision risks. This system mitigates such risks through automated visual and audio alerts, improving crossing behavior.

Its accurate vehicle detection, even in low visibility, ensures safer crossings. The system's child-friendly signals enhance safety for school children, reducing confusion and promoting compliance.

Conclusions

- Ensuring the safety and security of crowded public environments remains one of the most pressing challenges of modern urban societies.

- Traditional surveillance systems, which depend heavily on human vigilance, often fall short in managing large-scale events where abnormal activities such as theft, violence, or disorderly conduct may arise suddenly.

- This research introduced SafeCrowd Vision, an intelligent AI-based framework designed to overcome these limitations by integrating state-of-the-art deep learning techniques for real-time multimodal anomaly detection.

Abstract—Public safety monitoring in busy places like transportation centers, markets, and large gatherings is hard because of things like people blocking views, complicated crowd movements, and not enough humans to watch everything. This paper introduces SafeCrowd Vision, a real-time system that uses multiple types of data to find suspicious actions, such as stealing, fighting, and unusual sounds. The system uses CNNs to look at images and LSTMs to understand how things change over time. YOLOv8 is used for fast object detection, and DeepSORT helps track people and objects even when they are hidden. The system checks if people are still with their belongings to spot theft, looking for sudden changes or missing items. At the same time, an audio part listens for strange sounds by looking at features like sound energy and how often the sound crosses zero. Combining video and sound helps the system work better in tough situations like crowded areas or dim lighting. Tests on standard datasets, fake theft situations, and real surveillance videos show that the system is accurate and fast enough for real-time use in smart city systems.

I. INTRODUCTION

Rapid urbanization and increasing population density have significantly raised safety concerns in public spaces such as transportation hubs, commercial areas, and large social gatherings. These environments often experience high crowd movement, making them vulnerable to incidents such as theft, violent behavior, and sudden disorder. Surveillance cameras are widely deployed to monitor such areas; however, traditional CCTV systems rely heavily on human operators to continuously observe multiple video feeds. This approach is not only labor-intensive but also unreliable, as prolonged monitoring can lead to fatigue, missed events, and delayed reactions—especially in fast-changing crowd scenarios.

Recent advancements in artificial intelligence and deep learning have enabled automated analysis of surveillance data, reducing dependence on manual monitoring. Computer vision techniques can now detect objects, track individuals, and analyze crowd movement patterns with greater consistency than human observers. Various studies have explored anomaly detection using convolutional autoencoders, recurrent neural networks, and optical flow-based approaches. While these methods show promise, many existing systems focus on detecting a single type of abnormal behavior and often operate offline or lack real-time responsiveness. Moreover, most surveillance frameworks rely solely on visual data, which limits performance in conditions such as poor lighting, occlusion, or dense crowds.

The proposed pipeline follows standard methods for detection and tracking, but the main contribution of this work is in how it combines multiple data sources, checks performance in real time, and offers practical advice for implementing the system, rather than creating a completely new structure.

To overcome these limitations, this paper proposes SafeCrowd Vision, a real-time multimodal surveillance system that combines visual intelligence and audio analysis to identify suspicious activities in crowded environments. The framework utilizes CNN-based feature extraction for spatial understanding and LSTM-based temporal modeling to recognize behavior patterns such as theft and violent interactions. Object detection and tracking are handled using YOLOv8 and DeepSORT, allowing the system to associate personal belongings with individuals and detect abnormal ownership changes. Additionally, an audio analysis module extracts acoustic features to identify shouting and sudden loud sounds, providing complementary evidence to visual observations.

SafeCrowd Vision's modular design makes it easy to work with current surveillance systems, giving it a real advantage when it comes to being used in actual settings.[2]
